

I encountered a couple of errors during this lab. One recurring error I got whenever I tried to run my file was "Uncaught Error: Unable to evaluate guard in transition for event 'RECOGNISED' in state node 'asr.Recognising': Cannot read properties of undefined (reading 'nlu')". Despite my efforts to debug the code, this error persisted, causing frustration and confusion.

After some days and several ways of identifying what causes the error, I discovered that the error stemmed not from my code itself but rather from inconsistencies within my local environment. This realization became evident when the code ran flawlessly on my classmate's laptop indicating that the issue was due to my setup.

Due to this, I wasn't able to work on the following tasks, since I wasn't able to testrun my file properly. I tried to reinstall yarn and check for other issues within my setup but the issue remained.
